REAL TOOMPLEE INCLEDECTION GENE. EVIDENCE against intron-dependent evolution for the roof.";

TO MOI. Biol. 190:291-317(1986).

1. FUNCTION: MUSCLE CONTRACTION.

1. SUBDILIT MUSCLE MOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2 HEAVY CHAIN SUBDILITS (MHC), 2 ALKALL LIGHT CHAIN SUBDILITS (MHC).

2. FEGULATORY LIGHT CHAIN SUBUNITS (MLC-2).

2. SUBDILIT MUSCLE COATION. THICK filaments of the myofibrils.

2. FEGULATORY LIGHT CHAIN SUBUNITS (MLC).

3. MND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC).

4. FUNCTION: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES.

3. CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.

4. CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.

5. CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.

5. CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.

6. IP PTM: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

5. MISCLELANBOUS: EACH MYOSIN HEWY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (HMM). IT CAN LAFER BE COLLED TO THE COLLS.

5. SPLIT FIRTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                     Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

New antigenic peptide from the CH3 domain of immunoglobulin E, fusions for immunization against allergy \cdot

```
antigence invention userines immunicationin to the present antibodies and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of 1gE, and so preventing triggering and activation of mast cells and basophils and so preventing triggering and activation of mast cells and basophils containing (I) are used for active immunisation against 1gE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints disaulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe maximize cross-reactivity to the natural target. They induce safe acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-anaphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for
          and so preventing triggering and activation of mast cells and basophils and downregulation of IgE synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgE-mediated containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunogenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergic disease; immunisation; anti-allergic; anti-asthmatic; asthma; anaphylaxis; dermatitis.

The present invention describes immunoglobulin E (IgE)-CH3 domain antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyglomal antibodies specific for a target effector site on the epsilon-heavy chain of IgE, and so preventing triggering and activation of mast cells and basophils and so preventing triggering and activation of mast cells and basophils. Containing (I) are used for active immunisation against IgE-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous Thelper cell epitope. Conjugates of in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (1) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent anino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunoglobulin E; IgE; epsilon heavy chain; antigenic; antigen; immunoglopenic; immunostimulatory; carrier protein; helper T cell epitope; antibody; allergy; allergy disease; immunisation; anti-allergic; anti-ansphylactic; anti-asthmatic; asthma; anaphylaxis; dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antigenic peptide from the CH3 domain of immunoglobulin E, fusions

(I) have anti-allergic, anti-anaphylactic and anti-asthmatic properties. (I) induces polyclonal antibodies specific for a target effector site on the epsilon-heavy chain of igs. and so preventing triggering and activation of mast cells and basophils and downregulation of igs synthesis. Conjugates, or fusion peptides, containing (I) are used for active immunisation against IgB-mediated allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy dermatitis. Nucleic acids that encode these compounds are useful for recombinant production of corresponding peptides or in DNA vaccines. Conjugates of (I) that include a promiscuous T helper cell epitope
(non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (functional in genetically diverse subjects), in addition to a B cell target epitope, have increased immunogenicity and may include cyclic constraints (disulfide bridge) to stabilise conformational features and maximize cross-reactivity to the natural target. They induce safe (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.

The invention relates to novel promiscuous T helper cell epitopes (Th), along with B cell epitopes. The Th epitopes of the invention along with B cell epitopes. The Th epitopes of the invention along with B cell epitopes. The Th epitopes and peptide immunogens containing them, are used to induce a T helper cell response, pertein (EFTP) or HIV epitopes, but more generally against any pathogen, immunoreactive self-antigen or tumour antigen. The Th epitopes and peptide immunogens may be used for prevention and/or treatment of infections (HIV, foot-and-mouth disease or malaria); for cancer infections (HRY) for contraception, treatment of hormone releasing hormone (LHRH) for contraception, treatment of hormone capendant cancer, prevention of boar taint in meat, and immunocastration); for promoting the growth of animals; or for treating allergies or arteriosciences. Incorporation of a promiscuous Th (functional in genetically diverse subjects) into an immunogen improves capacity to induce a strong T helper cell-mediated immune response, resulting in production of antibodies against a target antipen. The contrace of antibodies against a target antipen.

Sequence AAY91121 represents a promiscuous T helper epitope frâm the measles virus F (MVF) protein and sequences AAY91122- V91142, AAY91226 and AAY91246 represent synthetic Th epitopes based on the MVF Th epitope. Sequence AAY91143 represents a promiscuous Th epitope
                                                                                                                                                                                                                                                                                                                                                                               Promiscuous T-cell epitope; measles virus F protein; MVF; hepatitis B virus surface antigen; HBV; immunogenic; B-cell epitope; luteinising hormone releasing hormone; LHRH; contraceptive; anticancer; somatostatin; growth promotion; CD4 receptor; HIV-1; antiviral; FMDV; foot and mouth disease virus; immunoglobulin E; IgE; anti-allergic; Plasmodium falciparum; circumsporozoite; antimalarial; CETP; cholesteryl ester transport protein; anti-arteriosclerotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New artificial T helper cell epitope and derived immunogens with target antigenic site, for immunization against e.g. malaria, arteriosclerosis or human immune deficiency virus

AAY91144-Y91155 are synthetic epitopes derived from this HBV epitope.
AAY91156-Y91196, AAX91227 and AAX91242-Y91244 are antigenic peptides
CC comprising an LHRH sequence joined to a promiscuous Th epitope. AAY91197
is the LHRH target antigenic peptide used in these LHRH antigenic
peptides comprising somatostatin, and AAY91201-Y91207 are antigenic
peptides comprising somatostatin, and AAY91201-Y91207 are antigenic
cpeptides comprising somatostatin and a Th epitope. Somatostatin
cimmunogens may be used to promote growth in livestock. AAY91208 is a
human CD4 CDR2 antigenic peptides which may be used to prevent HIV
ciffection of T cells. AAY90212 is a modified version of a human IgE
confidence peptides which may be used in the treatment of allergies.
AAY91220 is a peptide which may be used in the treatment of allergies.
AAY91221 is a plasmoddum falciparum circumsporzozite (CS) target
antigen, and AAY91221 se and AAY91231-Y91222 comprise this peptide and Th AAY91235 comprise the immunogens comprising a
comprising peptides and AAY91231-Y91235 comprise the immunogens comprising
antigen, and AAY91231 se and AAY91231-Y91232 comprise the immunogens comprising a
comprise and may be used in a malaria vaccine. AAY91288-Y91231 represent
comprised to prevent or treat
are HYV neutralising B-cell epitopes. AAY9128-Y91251 and
AAY91288-Y91273 are antigenic peptides comprising WYH Th and HYV-1 B-cell
comprised by thich may be used as a component in an anti-HIV-1 vaccine.
AAY91198 and AAY91199 are respectively an immunostimulatory invasin
contein epitope from Yersinia specias, and hinge spacer peptide, both of
contein epitope from Yersinia specias, and hinge spacer peptide,
comprised by the antigenic peptides, and hinge spacer peptide,
comprised by the antigenic peptides of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                      Synthetic helper T cell (Th) epitope and a target antigen, luteinising hormone-releasing hormone (LHRH). The peptide immunogens cause hormone-releasing hormone (LHRH). The peptide immunogens cause hormones pecific immune response to LHRH which is involved in regulation of specific immune response to LHRH which is involved in regulation of specific immunogenesis, own attain of a promiscuous T helper and secretion of sex hormones. Provision of a promiscuous T helper and secretion of sex hormones. Provision of a promiscuous T helper optimum immunogenity to the B cell epitopes of the target antigen and thus high antibody titres against the target antigen. The peptide immunogens of the invention are used to vaccinate against mammalian LHRH, for use as (reversible) contraceptive; control of hormone-dependent tumours (cancer of prostate or breast, also endometriosis); to prevent boar taint (and improve meat quality) and for immunocastration. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel binding protein which specifically binds to native canine free or B-cell bound IgE, and which doesn't bind to IgE when the IgE is bound to mast cells. The peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Canine; allergy; antibody 15A.2; IgE; B cell; mast cell; anti-allergy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel binding protein which specifically binds to native canine free or B-cell bound IgE, and which doesn't bind to IgE when the IgE is bound to mast cells. The peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          It is the new sequence No 11 and has an anti-allergic effect. It binds IgE receptors on cell surfaces and inhibits IgE binding to receptors. can be used as an anti-allergic drug, having no side effects.
                                                                                                                                               Peptide which binds to Immunoglobulin E (1gE) receptors inhibiting 1gE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Canine; allergy; antibody 15A.2; IgE; B cell; mast cell; anti-allergy;

This invention describes a novel binding protein which specifically binds to native canine free or B-cell bound IgE, and which doesn't bind to IgE when the IgE is bound to mast cells. The peptide products of the invention have anti-allargic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allargic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

                                                                                                                                                                                                                                                                     ö
binds to native canine free or B-cell bound IgE, and which doesn't bind to 19g when the IgE is bound to mast cells. The peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

The peptide products of the invention have anti-allergic activity. The antibodies bind to defined epitopes on free or B-cell bound IgE molecules which have an important role in allergic reaction. The specific binding proteins are used to produce a pharmaceutical composition, preferably with a diluent, which can be used for prophylaxis or treatment of canine allergy.

AAW24098-106 are peptide fragments containing at least 5 continuous maino acids of the partial canine immunoglobulin E (19E) protein shown in AAW24097. The peptides are used for the preparation of anti-canine IgE antibody. The anti-canine IgE antibody can be used for the diagnosis
                                                                                                                                                                                                                                                        Immunoglobulin E; IgE; anti-canine IgE antibody; allergy; canine; dog.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
